

Margarita Machines

Prepare Products For Use:

Put water in the fridge, if possible. Make sure it is ICE COLD.

Put your alcohol in the FREEZER if you have room. The reason you will like having gone through all this trouble is that your drinks will be ready in a flash since all of your ingredients are already at 35 degrees.

No need for any ice. All you do is add the mix, water, and alcohol of choice.. Our machine makes the magic happen!

Electricity:

DEDICATED standard 110 circuit with 15 amps. This means NOTHING else should be on this circuit or else the margarita machine WILL NOT WORK. Pick a place that is within 6 feet of an electrical outlet.

No Extension Cords!

If you use an extension cord, it must be 10-12 gauge and no more than 25 ft long. Any other cord WILL NOT WORK. We also do not recommend using adapters or multiple outlets. Keep away from water!

How To Deal With Hot Days:

If possible, use the machine in a air conditioned area. Sure it is not poolside but this will make sure it is always freezing to maximum efficiency. Still want it outside? Make sure it is in a shady area. When the temperature outside gets over 90 degrees the machines have to work extra hard to keep up with all your thirsty guests!

Proper Ventilation:

Place the machine so that no heat sources are near the grilled walls. Make sure that there is a free space of at least 12" all around the machine. If the space around the machine is not adequate for the ventilation, it will only partially cool.
